**TYLER SAMPLES 55 METERS GRADING 8.8% ZINC, 0.25% COPPER,  
8.7 G/T SILVER AND 7 METERS GRADING 14.73% ZINC,  
7.6 G/T SILVER IN MECHANIZED TRENCHING AT BAHUERACHI.**

Tyler Resources Inc. is very pleased to announce assay results from continuing surface exploration work in the northern part of the Bahuerachi Claim block, which confirm the discovery of a significant new center of mineralization roughly 5 kilometers from the Bahuerachi Main Zone porphyry-skarn deposit.

Mechanized trenching and representative continuous chip sampling of road cuts in the Cerro Prieto-Silica Hill area have confirmed the presence of widespread high-grade mineralization at surface. The trenching program was conducted following prospecting surface results as disclosed in January 2007. The Company is pleased to observe that trenching has both expanded on the initial surface results and located higher grade zones with good geological continuity in all targets tested to date.

A summary of highlights from the spring sampling program, in which 500 chip samples were collected, is presented below. General locations of mineralized intersection are presented on the attached map. Further work is being carried out at all the identified mineralized zones in preparation for a planned drilling program later in the year, as the current drilling program in the Main Zone will allow.

## **Mechanized trench representative continuous chip samples, Highlights, North Bahuerachi**

<b>Area</b>	<b>Interval (m)</b>	<b>Zinc (%)</b>	<b>Copper (%)</b>	<b>Gold (g/t)</b>	<b>Silver (g/t)</b>	<b>Lead (%)</b>	<b>Comments</b>
Cerro Prieto	10.5	4.17	0.9	0.016	34.9	0.29	Sulphides/skarn/limestone
Silica Hill	55	8.84	0.25	0.01	8.7	0.18	Skarn/sediments
Silica Hill	7	14.73	trace	0.01	7.6	0.16	Skarn/sediments
Silica Hill	53	4.55	0.34	trace	8.1	0.17	Skarn/sediments
Silica Hill	24	4.85	trace	trace	7.5	0.12	Skarn/sediments
Silica Hill	15	4.42	0.26	0.06	26.6	0.53	Skarn/sediments
Coyote	29	2.59	0.12	trace	2.4	0.13	Limestone/skarn

\* True widths of mineralization are interpreted to vary between 70-80%+ of quoted widths based on surface work to date. Most composites quoted above begin and end in mineralization.

## **About Tyler**

Tyler Resources is a well-funded junior exploration company focused on base and precious metals exploration in Mexico. Tyler's primary project is the Bahuerachi property, which hosts Mexico's fourth largest mineralized porphyry copper deposit (+Au, Ag, Mo, Zn). The Company is now in the advanced stage of an expanded 35,000 meter combined diamond and reverse circulation drilling program making it one of the most active Canadian junior exploration companies operating in Mexico.

All assay work was performed by ICP at ALS-Chemex labs of Vancouver, with gold done using standard fire assay methods. All samples sent to the lab are sealed with security tags for delivery to ALS-Chemex. Duplicate samples as well as standards and blanks are inserted in each batch of samples delivered to the laboratory and then checked to ensure proper quality assurance and quality control (QA/QC).

The Qualified Person responsible for the design and implementation of the Field Program as well as the preparation of this news release was J. P. Jutras, P.Geol., and President of the Company. The work program is being carried out with the participation of Dr. Shane William Ebert, Ph.D, P.Geo, Vice President and Director, Grant Couture, M.Sc Geology, Paul Turnbull, B.Sc, P.Geol, Cornell McDowell, B.Sc Geology, and Charla Boyer, B.Sc Geology, consultants to the Company.
